**Keywords:** Security-based precautionary behaviors; Comparative analysis; Cybersecurity awareness; Information security

## **Abstract:**

The proliferation of remote work arrangements, accelerated by technological advancements and global events such as the COVID-19 pandemic, has transformed traditional office environments. While remote work offers flexibility and convenience, it also introduces new security challenges, as employees operate outside the confines of centralized office networks. This research aims to investigate the variance in security-based precautionary behaviors among employees when working from home compared to working from the office.
